# 1

## What is this for?

This is not meant as a guide to learn Angular but as a cheat-sheet to get started quickly when it has passed a few weeks since your last angular project and you need to refresh your memory. I hope it can be useful.

# 2

## Creating a new project

### 2.1 Installing Angular CLI

Firstly we install the [Angular CLI](#) if it isn't already present:

```
1 | npm install -g @angular/cli
```

### 2.2 Creating a project

Obviously you will want to create a new project, and of course you will want to have [Sass](#), [Bootstrap](#), its UI for angular [UI Bootstrap](#) and an angular UI framework such as [PrimeNG](#). To get all of this, just type the following:

```
1 | ng new My_New_Project --style=sass
```

Then after having entered the directory ( `cd Project` ) we just install the packages:

```
1 | npm install primeng bootstrap angular-ui-bootstrap --save
```

```
1 | npm install node-sass --save-dev
```

### 2.3 Creating a component

```
1 | ng generate component MyCustomComponent
```
